

Fruitect®Mango is a coating formulation for Philippine "carabao" mango fruits.

Coated mangoes stay unripe and firm for a longer period making it more resistant to physical injury. Thus, the coated fruits can be transported to distant markets and have a longer shelf life.

The main components of Fruitect®Mango are derived from natural biomaterials and are biodegradable. Unlike wax-based coatings, Fruitect®Mango is water soluble.

Fruitect® Mango

Fruitect®Mango is applied on fresh mature mango fruits. Coated fruits stay green and firm for a longer period by delaying ripening, minimizing moisture loss and shriveling. Firm fruits can be transported to distant places because they are more resistant to physical injury like abrasion, dents and disease.

Fruitect®Mango can open new markets for Philippine mango. Most of all, it reduces losses due to spoilage which can go up to 50%.

The main components of Fruitect®Mango are derived from natural biomaterials and are biodegradable. The coating is odorless, colorless, tasteless, and makes the fruit a bit shiny. Unlike wax-based coatings, Fruitect®Mango is water soluble.
